

PLATFORM SPECIFICATION

DealPME v0

Platform Description & Software Requirements Specification

Business transmission, acquisition and restructuring platform • Togo • OHADA / UEMOA

Document	DealPME v0 — Platform Description & Software Requirements Specification
Primary reader	Development team and AI coding agents
Pilot jurisdiction	Republic of Togo (UEMOA / OHADA)
Institutional model	Co-branded SaaS operated with the Chambre de Commerce et d'Industrie du Togo
Regulatory posture	Software operator; closed-circle disclosure for share transactions
Interface languages	French (source) / English (derived)
Document owner	DealPME product and engineering
Prepared by	DealPME technical direction
Approved by	Bruno H.
Approval date	25 June 2026
Version	v0 (approved baseline)
Next scheduled review	At Phase 1 exit

Contents

1. Purpose and how to use this document

What this document is for, who reads which part, and the conventions that apply throughout.

This specification defines the DealPME platform in enough detail to be built. It merges the product description and the software requirements into a single governed baseline so that engineering, compliance and institutional reporting all draw on one source.

Read Section 3 before writing any code. It contains legal constraints that determine the database schema, the permission model and the onboarding flow. These are not preferences. Retrofitting them is a rewrite.

1.1 Reading paths

If you are	Read
Everyone, first	1, 2.2, 3.1 to 3.4, 9 (conventions). Roughly 40 minutes.
Technical lead / architect	All sections, plus Annex A
Backend engineer	3.3, 3.4, 5, 6, 7, 8, 9, 10
Frontend engineer	4, 6, 7, 9.2, 11.4, 12
DevOps / SRE	3.5, 8, 9.5, 10, 11, 14
QA	3.3, 3.4, 6, 7, 11, Annex C
Legal and compliance	2.2, 3, 5.4, 10.3, Annex A
AI coding agent	Annex D first, then the sections it names, in the order it names them

1.2 Requirement identifiers and priority

Requirements are numbered **DP** - <MODULE> - <NNN>. Modules: **IDN** identity and subscription, **MKT** marketplace, **VDR** data room, **LEG** document generation, **REB** distressed assets, **CNX** networking, **CCI** institutional console, **RPS** regulatory perimeter, **FIN** fees and revenue reporting, **OPS** operations.

Priority	Meaning
P0	Launch blocker. The pilot cannot go live without it.
P1	Required within the pilot period.
P2	Post-pilot backlog.

"MUST" and "MUST NOT" are mandatory. "SHOULD" is a strong default: deviation requires a recorded decision. "MAY" is optional.

1.3 Change control

This document is the single source of truth for scope. Any change touching Section 3 requires sign-off from legal counsel and from the partnership owner before implementation, because those constraints derive from statute and from commitments already made.

CONFIDENTIAL • NOT TO BE DISTRIBUTED

2. Product definition and scope

What DealPME does, what it deliberately does not do, and the boundaries of the pilot.

2.1 The platform

DealPME is a co-branded B2B transaction infrastructure platform for Togolese small and medium enterprises, delivered in partnership with the Chambre de Commerce et d'Industrie du Togo (CCIT). It organises seven service pillars:

#	Pillar	Function
1	Pass Transmission	Confidential marketplace for business transmission and acquisition, with initial anonymity and rule-based matching.
2	Guichet Diaspora & Investissement	Verified opportunity portal for diaspora and institutional investors, with watchlist, alerts and secure appointment booking.
3	Label "Deal-Ready"	Preparation programme and CCIT digital certification badge.
4	Alerte & Rebond	Confidential support for businesses in difficulty and a marketplace for assets to restructure.
5	Conformité & Fiscalité	Tax simulation, simplified filing and certificates, through a third-party partner module.
6	Hub Deal-Connect	Sector-based virtual trade shows and B2B speed-meetings, including AfCFTA-oriented programming.
7	Legal-Tech OHADA	Automated generation of standardised legal documents.

2.2 What DealPME is not

Stating this precisely is a legal requirement, not modesty. It constrains the words in the interface as much as the licence file.

- DealPME does **not** act as a regulated securities intermediary, investment adviser, business introducer or canvasser within the meaning of the regional market rules.
- DealPME is **not** a party to any transaction concluded between users. Every transaction decision rests solely with the parties to it.
- DealPME does **not** value businesses. Summary financial assessments are indicative and non-binding.
- DealPME does **not** provide legal, tax, accounting or regulatory advice. The Legal-Tech and Conformité & Fiscalité modules are drafting and simulation aids, never a substitute for a qualified professional.
- DealPME does **not** hold or transmit transaction consideration in v0. There is no escrow and no settlement.
- DealPME does **not** guarantee that any transaction, fundraising or disposal will complete, nor the accuracy of information supplied by users.

■ Constraint on interface copy

The regional market rules prohibit an unlicensed entity from using a name, corporate name, advertising or any expression suggesting licensed status. Product copy, microcopy, notification text and marketing material MUST be audited against the list above before launch. This is requirement **DP-OPS-090 (P0)**.

2.3 Pilot scope

Parameter	Value
Jurisdiction	Republic of Togo
Legal frameworks	OHADA uniform acts (AUSCGIE, AUDCG, AUPCAP); Law 2019-014 on personal data protection; Law 2017-007 and Decree 2018-062 on electronic transactions; Law 2017-006 (LOSITO)
Regulators in scope	IPDCP (data protection); ARCEP and the electronic certification authority (trust services); the regional market authority (securities perimeter); BCEAO and the banking commission (institutional counterparties)
Currency	XOF (FCFA), fixed at 655.957 FCFA to 1 EUR
Territorial exclusivity	National territory of Togo. Expansion beyond Togo is not precluded and is treated as a v1 question.
Interface languages	French as source language, English derived

Out of scope for v0

- Escrow, payment of transaction consideration, settlement.
- Any application for a securities intermediary licence.
- Biometric identity verification (deliberately deferred: see 3.5.3).
- Automated valuation presented as DealPME's own opinion of value.
- Native mobile applications. Responsive web only.
- Deployment outside Togo.

2.4 Glossary

Term	Definition
APE	*Appel public à l'épargne*: public offering of securities, as defined at AUSCGIE articles 81 and 83.
Asset deal	Sale of a business as a going concern (*cession de fonds de commerce*) under the AUDCG. Transfers no securities.
Share deal	Transfer of *actions* or *parts sociales*. Potentially within the APE perimeter.
AUPCAP	Uniform act organising collective proceedings for the discharge of liabilities, as revised on 10 September 2015.

Term	Definition
CFE	*Centre de Formalités des Entreprises*: Togo's one-stop company registration window, housed at the CCIT.
Eligible member	A CCIT member whose active status is confirmed by the CCIT and whose account is attributable to a CCIT channel.
IPDCP	*Instance de Protection des Données à Caractère Personnel*: Togo's data protection authority.
Net revenue	Amounts actually collected, excluding tax, after deduction of refunds, cancellations, credits, discounts, chargebacks and unpaid items; payment processing costs; and amounts passed to third parties where DealPME acts only as collector.
PSAE	Accredited electronic archiving service provider.
PSC	Certification service provider; "qualified" when accredited.
RCCM	*Registre du Commerce et du Crédit Mobilier*: official commercial register.
RPS	Regulatory Perimeter Service (Section 3.4).
Sufficient information	The AUSCGIE article 83 threshold at which a communication becomes an offer to the public.

3. Regulatory architecture

Binding constraints. This section governs schema, permissions, copy and launch sequencing.

3.1 The primary exposure is transaction nullity

Under the AUSCGIE, an offer to the public of securities is constituted by a communication addressed in any form and by any means to persons, presenting sufficient information on the terms of the offer and on the securities offered, such as to put a person in a position to consider buying or subscribing them; or by a placement of securities through financial intermediaries (article 83).

Article 82 goes further. Companies not authorised by the uniform act may not make a public offering, and separately **any person is prohibited from transferring by way of public offering the securities of a company not authorised to make one. Any operation carried out in breach is void.**

Apply that to the target segment. The SARL is the standard SME form in Togo and is not authorised to make a public offering. The SAS is likewise prohibited. Only the SA qualifies, and the single-shareholder option is not available to an SA making a public offering.

■ Why this is an engineering problem before it is a legal one

A share sale in a Togolese SARL, sourced through an openly advertised listing that crossed the article 83 threshold, is exposed to **nullity of the transaction**. The seller loses the deal, the buyer's capital is unwound, and the platform is the proximate cause. No amount of disclaimer text cures a void transaction. The defence has to be built into the data model.

Two aggravating factors. First, where a financial market covers several member states, they are treated as a single state for these purposes, and the regional exchange covers eight: operating only in Togo does not by itself narrow the perimeter for share deals. Second, the intermediary functions are all licensed, including business introducers and canvassers, with professional cards issued to individuals. There is no unlicensed position that consists of introducing counterparties and charging on completion.

3.2 Adopted posture

Layer	Decision
Base	DealPME operates as a software provider. Subscription and service revenue require no perimeter analysis.
Asset deals	Openly listed, openly advertised, openly matched. Outside the securities perimeter entirely (3.3).
Share deals	Confined to a closed circle enforced by the Regulatory Perimeter Service (3.4). Never publicly advertised with deal-identifying information.
Transaction fees	Implemented as a specified module, gated behind a feature flag that MUST NOT be enabled until a written legal opinion is recorded and, where that opinion requires it, transaction execution is routed to a licensed partner (3.6). The engine, the fee schedule and the reporting are built in v0; activation is a separate, evidenced decision.
Own licence	Out of scope for v0. A corporate decision for a later stage.

■ Note on sequencing

This posture does not remove transaction-fee revenue from the model. It separates **building** the capability from **switching it on**, so that activation is a documented decision resting on counsel's opinion rather than an implicit consequence of shipping code.

3.3 Deal-type bifurcation

DP-RPS-001 (P0). The system **MUST** model two distinct deal types from the first migration. This is not a status flag on a shared table: the types have different lifecycles, different disclosure rules and different regulatory treatment.

Type	Legal basis	Disclosure regime
ASSET_DEAL	Sale of a going concern (*cession de fonds de commerce*) under the AUDCG: goodwill, equipment, lease rights, stock, commercial name. No securities transferred, so AUSCGIE 81 to 83 do not apply.	Open. Public listing, advertising and matching permitted.
SHARE_DEAL	Transfer of *actions* or *parts sociales*. Potentially within the APE perimeter.	Closed circle. Full RPS gate.

■ Why this matters commercially

The bifurcation creates a fully compliant, openly marketable transaction surface carrying no nullity risk. Pilot liquidity should be built there first (Section 13). Without the split, every listing inherits the worst-case regulatory treatment.

ID	P	Requirement
DP-RPS-002	P0	For every SHARE_DEAL , capture and store the target's legal form (SA / SARL / SAS / SNC / SCS / GIE / SOCIETE_CIVILE / AUTRE), verified against the RCCM.
DP-RPS-003	P0	Where legal form is SARL , SAS , SNC or SCS , apply the strictest disclosure regime and display a persistent, non-dismissible notice to the seller and to every admitted investor explaining that these securities may not be transferred by way of public offering and that disclosure is therefore restricted to a closed circle.
DP-RPS-004	P1	Offer the seller a guided view of the asset-deal alternative where legally feasible, presented as information with a referral to counsel, never as advice.

■ Acceptance criteria — DP-RPS-003

Given a share deal whose target is a SARL, **when** the seller attempts to publish it to the open marketplace, **then** publication **MUST** be refused with an explanatory message, the deal **MUST** remain in **RESTRICTED_CIRCLE** visibility, and an entry **MUST** be written to the immutable

regulatory log.

3.4 Regulatory Perimeter Service

DP-RPS-010 (P0). The RPS MUST be implemented as a discrete service with its own datastore and an append-only log. Because the burden of demonstrating that the platform stayed outside the public-offering perimeter falls on DealPME, the log is the compliance artefact of record.

Function	Behaviour
Disclosure counter	Maintains, per share deal, a count of distinct natural or legal persons who have received sufficient information. Counts persons, not sessions or page views.
Relationship graph	Records declared legal connections between admitted persons, since the statutory test concerns persons with no legal connection between them. Connected parties count once.
Circle cap	Enforces a hard configurable ceiling. Default 50, deliberately set well below the statutory 100-person reference to preserve margin.
Qualification register	Stores each investor's declared status, the evidence supplied and the reviewer's decision.
Communication gate	Every outbound communication about a share deal passes through the RPS, which permits, redacts or blocks it.
Immutable log	Append-only, hash-chained, exportable as an evidence pack.

3.4.1 Disclosure tiers

DP-RPS-011 (P0). Every disclosure about a share deal MUST be classified into one of three tiers. Tier escalation MUST NOT occur without the corresponding gate.

Tier	Content permitted	Gate	Counts?
T0 — existence	Sector, broad region, size band. No company identity, no price, no terms, nothing enabling a purchase decision.	Authenticated account	No
T1 — teaser	Anonymised financial profile and commercial description. No price, no valuation, no offer terms.	Verified account plus circle admission	Yes
T2 — full	Company identity, price expectation, terms, data room access.	Executed NDA plus recorded qualification	Yes

ID	P	Requirement
DP-RPS-012	P0	Price, valuation and offer terms MUST NOT be rendered in any T0 or T1 surface, in any channel: web, email, push notification, search snippet, Open Graph metadata or PDF export. Enforce server-side by field-level allow-list, never by frontend conditional rendering.

ID	P	Requirement
DP-RPS-013	P0	No share-deal content at T1 or above may be indexed by search engines, included in a sitemap, or served to an unauthenticated request. Robots directives are insufficient: enforce at the application layer.
DP-RPS-014	P0	No unsolicited electronic commercial communication. Togolese law prohibits advertising by electronic message without the recipient's prior consent, so every alert, digest and campaign requires a granular, timestamped, revocable opt-in, retained as part of the evidence pack.
DP-RPS-015	P0	At 80 % of cap, notify the compliance operator and switch the deal to manual admission. At 100 %, refuse further admissions until a person is removed and the removal is logged with a reason.
DP-RPS-016	P1	Expose a per-deal evidence pack export: disclosure ledger, admission decisions with reviewer and timestamp, consent records, executed NDAs with signature evidence, and the hash chain, as one signed archive.

■ Acceptance criteria — DP-RPS-012

Given any T1 payload for a share deal, **when** the API response is serialised, **then** **askingPrice**, **valuation**, **ebitdaMultiple**, **offerTerms**, **companyName** and **rccmNumber** MUST be absent from the response body, and an automated test MUST assert their absence for every T1 endpoint.

■ Consequence for the matching feature

Automated matching alerts are opt-in only, and the opt-in record is part of the compliance evidence. Any design in which the platform pushes deal alerts to users who have not explicitly consented is non-compliant regardless of how useful the match is.

3.5 Personal data — Law 2019-014

Togo's Law 2019-014 of 29 October 2019 governs the collection, processing, storage and transmission of personal data and created the IPDCP as an independent authority. The law establishes three regimes: declaration, authorisation and request for opinion. The IPDCP issues a receipt within a maximum of one month and processing may only begin once it is obtained. Prior authorisation is required for certain categories, expressly including genetic, health, criminal and biometric data. The IPDCP also authorises transfers abroad. Its enforcement toolkit includes formal notices, administrative fines, temporary suspension of processing and referral to the courts.

3.5.1 Controller position

DealPME acts as **data controller** for the personal data that members and users supply directly when creating their account, for the purposes of delivering the services. The CCIT remains controller for its own member database, which it does not transmit to DealPME. Consequently the IPDCP filings, the privacy notice and the breach-notification duty for platform data sit with DealPME.

3.5.2 Launch gates

ID	P	Requirement
DP-OPS-001	P0	The platform MUST NOT process production personal data before the IPDCP receipt is obtained. The one-month statutory clock is a hard schedule dependency, not a parallel workstream.
DP-OPS-002	P0	No hyperscaler operates a region in West Africa: the nearest are Cape Town and Johannesburg, with Lagos-to-Johannesburg latency around 95 to 140 ms. Any hosting decision therefore places production personal data outside Togo, so an IPDCP cross-border transfer authorisation is a launch blocker . Record the authorisation reference in configuration and surface it in the privacy notice.
DP-OPS-003	P1	Segregate a high-sensitivity subset (identity documents, data room document bodies) behind a configurable storage location, so that a later move to in-country hosting is a configuration change rather than a migration project.
DP-OPS-004	P0	Every field in the data dictionary MUST carry a classification: PUBLIC , INTERNAL , PERSONAL , SENSITIVE_PERSONAL or CONFIDENTIAL_DEAL . Access control, log verbosity, retention and export behaviour derive from it.

3.5.3 Deliberate deferral of biometric verification

DP-IDN-020 (P0). v0 **MUST NOT** implement biometric identity verification such as facial recognition or liveness matching against an identity photograph. Biometric data falls under the prior-authorisation regime, which would add an approval dependency of uncertain duration to the critical path.

v0 verification instead relies on identity document capture with human review, RCCM extract verification through the CCIT channel, telephone verification by one-time code, and, for legal persons, verification of the representative's authority. **DP-IDN-021 (P2)** permits biometric verification post-pilot, gated on an IPDCP authorisation and implemented behind a feature flag.

3.6 Electronic signature and evidentiary weight

The NDA gate carries the entire trust proposition. Its enforceability determines whether a seller will ever upload a tax return.

Togo's framework is Law 2017-007 of 22 June 2017 on electronic transactions with Decree 2018-062, alongside Law 2017-006. It recognises the electronic written form as equivalent to paper for contractual obligations, evidence, signature and invoicing, and creates a certification authority. Trust service providers supply certification, electronic archiving, timestamping and registered electronic delivery; they carry statutory liability and mandatory professional liability insurance. Certificates are qualified only where issued by an accredited, compliant provider. ARCEP acts as delegated authority for electronic certification. Critically, the reliability of the signature process is **presumed until proof to the contrary** where the statutory conditions are met.

ID	P	Requirement
DP-VDR-001	P0	NDA execution MUST use a signature attracting the statutory presumption of reliability, that is a qualified certificate from a provider accredited under the Togolese framework. Selecting a generic international e-signature API does not discharge this: without the presumption, DealPME carries the burden of proving reliability at exactly the moment the product is being judged.
DP-VDR-002	P0	No person may be compelled to sign electronically. Provide a documented fallback: generate the NDA as a PDF for wet-ink execution, accept a scanned

ID	P	Requirement
		counter-signed copy, record CCIT counter-verification. Deals MUST NOT be blocked for users who decline electronic signature.
DP-VDR-003	P1	Archive the audit trail with an accredited electronic archiving provider so its evidentiary weight survives the retention period. An application database table is not an archiving service.
DP-VDR-004	P0	Every NDA MUST carry a dispute-resolution clause. Recommended default: mediation before the Centre d'Arbitrage, de Médiation et de Conciliation de Lomé, then the courts of Lomé. Rationale: Togo ranked 15th globally and 1st in Africa on the Doing Business 2020 *Starting a Business* indicator while remaining weak on contract enforcement, so the trust proposition must rest on the strength of the evidence pack and a structured escalation path.

3.6.1 Licensed-partner integration boundary

ID	P	Requirement
DP-RPS-020	P0	Define and implement, as a dormant interface, a handoff to a licensed intermediary comprising: a mandate record linking seller, deal and partner with scope and dates; a consented identity-data transfer package; a status webhook for partner-side progress; and a recorded liability demarcation on the deal.
DP-RPS-021	P0	The transaction-fee engine MUST be gated by a feature flag whose activation requires a recorded legal opinion reference and, where required by that opinion, a partner licence reference. Until activation, the system MUST NOT display, invoice or accrue any fee contingent on transaction completion. Enforce as a server-side invariant, not a pricing-page omission.

3.7 Distressed assets — mapping to AUPCAP

The mechanism the Alerte & Rebond service needs already exists in statute, and aligning to it is both more defensible and more persuasive institutionally. The AUPCAP as revised on 10 September 2015 introduced the option for any enterprise to request mediation before ceasing payments, simplified procedures for *règlement préventif*, *redressement judiciaire* and *liquidation des biens*, and the preventive **conciliation** procedure. Conciliation is open to debtors facing established or foreseeable difficulties who are not yet in cessation of payments, and aims at an amicable agreement with principal creditors. Decisively, **anyone with knowledge of the conciliation is bound by confidentiality**. The act also defines *petite entreprise* as a term of art and professionalises the *mandataire de justice* function.

ID	P	Requirement
DP-REB-001	P0	Position and implement the module as a digital front end to statutory conciliation and *règlement préventif*, not as an independent workaround. Interface copy MUST reference the statutory procedures.
DP-REB-002	P0	Where a listing is linked to an ongoing conciliation, apply an elevated confidentiality regime: no public surface at any tier, access by named invitation only, explicit confidentiality acknowledgement captured from every viewer, full disclosure logging. The statutory duty binds every person with knowledge of the procedure, including platform staff, so administrative access MUST also be logged and minimised.

ID	P	Requirement
DP-REB-003	P0	Warn the seller before publication that signalling financial difficulty may trigger acceleration or cross-default clauses in existing credit agreements, and require an acknowledgement. Listing a distressed business is not a neutral act.
DP-REB-004	P0	Handle bank-held non-performing loans and seized assets under a separate flow with a distinct counterparty type. Collective procedures apply to entities under a special regime only where their specific regulation does not provide otherwise, and credit and microfinance institutions are expressly within that category. Bank onboarding MUST be a manual, agreement-gated process with no self-service path.
DP-REB-005	P1	Ingest dissolution and liquidation legal announcements as a distress-signal feed. The CFE site is a recognised support for legal announcements covering creation, modification and dissolution: a legitimate, public, authoritative origination source.

3.8 Financial crime

ID	P	Requirement
DP-IDN-030	P0	Sanctions and politically-exposed-person screening at onboarding, re-screened on a schedule, with results stored as decisions carrying reviewer identity, not as raw provider payloads.
DP-IDN-031	P0	A suspicion escalation workflow with a named responsible officer and a documented internal reporting route. Suspension of an account or service on established fraud or non-compliance risk MUST follow a defined procedure: prior written notification and a 48-hour response window, except in proven and documented urgency.
DP-IDN-032	P1	Surface the external financial relations regime in diaspora investor journeys. Where reinvestment outside the union has not been authorised, liquidation proceeds must be repatriated in full through an approved intermediary, and certain operations require prior ministerial authorisation. Presenting this early prevents the journey collapsing at closing, which is the failure mode the diaspora proposition is most exposed to.

3.9 Compliance launch gate

Production launch MUST be blocked until every row closes. Implement as a checklist in the release pipeline with named owners.

#	Gate	Owner	Evidence
G1	IPDCP declaration filed and receipt received	DPO	Receipt reference
G2	IPDCP cross-border transfer authorisation obtained	DPO	Authorisation reference
G3	Qualified certification provider contracted; certificate chain validated; insurance certificate on file	Tech lead	Accreditation reference
G4	NDA, terms of use and privacy notice reviewed by Togolese counsel	Legal	Signed opinion

#	Gate	Owner	Evidence
G5	Written opinion that the RPS design keeps share deals outside the public-offering perimeter	Legal	Signed opinion
G6	RPS cap enforcement and tier field-suppression verified by automated test	QA	Test report
G7	Interface copy audited against Section 2.2	Legal and Product	Audit log
G8	Revenue-share calculation journals reproducible from an independent recomputation	Finance	Reconciliation report
G9	DPO appointed	Executive	Appointment record
G10	Independent penetration test completed; critical and high findings remediated	Security	Test report

4. Personas and access control

Who uses the platform and what each role may do.

Persona	Primary job
Seller	Reach qualified counterparties without public exposure.
Investor, domestic	Find verified deal flow within the union.
Investor, diaspora	The same, plus remote due diligence and cross-border compliance guidance.
Advisor	Manage several client mandates under one account.
Bank or financial institution	Dispose of non-performing loans and seized assets discreetly.
CCIT officer	Confirm member status, operate certification, programme events.
Third-party expert	Perform diagnostics and audits for certification, under CCIT selection.
Compliance operator	Keep every share deal inside the perimeter.
Platform administrator	Operate the system.
Licensed partner (dormant in v0)	Execute regulated transaction legs.

4.1 Permission matrix

Expressed as capability to permitted roles, rather than as a grid, because this is the form that translates directly into a policy table. **R** read • **W** write • **A** approve • **X** execute. Any role not listed for a capability has no access to it.

Capability	Permitted roles	Constraint
Create asset-deal listing	Seller W • Advisor W • Bank W	Advisor requires an active mandate
Create share-deal listing	Seller W • Advisor W	Banks excluded
View T0 content	All authenticated roles R	Experts excluded
View T1 teaser, asset deal	All authenticated roles R	Open surface
View T1 teaser, share deal	Seller R (own) • Investor R • Advisor R • CCIT R • Compliance R	Investor and advisor only after circle admission
View T2 and company identity	Seller R (own) • Investor R • Advisor R • CCIT R • Compliance R	Requires executed NDA; admin access is break-glass only
Request circle admission	Investor X • Advisor X	
Approve circle admission	Compliance A	Human decision mandatory (DP-RPS-031)
Grant data room access	Seller A • Advisor A • Bank A	Scoped to a document set, with expiry

Capability	Permitted roles	Constraint
Upload data room document	Seller W • Advisor W • Bank W	Advisor requires mandate
Download a document	Seller • Investor • Advisor • Bank	Only where the seller has enabled download on that document
View data room audit trail	Seller R (own) • Advisor R (mandated) • Bank R (own) • Compliance R • Admin R	
Execute NDA	Seller X • Investor X • Advisor X • Bank X	
Generate a legal document	Seller X • Investor X • Advisor X • Bank X	Subject to tier entitlement
Confirm member status	CCIT X • Compliance R	Platform never holds the membership database
Award or revoke Deal-Ready	CCIT A	Named officer only; automated award impossible
Submit certification diagnostic	Expert W • CCIT R	Expert scoped to one file, access expires on submission
Verify against RCCM	CCIT X • Compliance R	
Create distressed listing	Seller W • Advisor W • Bank W	Bank onboarding is manual and agreement-gated
Access a conciliation-linked listing	Seller (own) • Investor • Advisor • Bank, by named invitation • Compliance R	Admin access is audit-logged break-glass
Create a Deal-Connect event	CCIT W • Admin W	
View revenue-share reporting	CCIT R • Compliance R • Admin R	Aggregate only
Override the circle cap	Compliance A	Mandatory reason, written to the regulatory log
Export an evidence pack	Compliance X • Admin X • CCIT R	

ID	P	Requirement
DP-IDN-001	P0	Permissions MUST be evaluated server-side on every request. Frontend route guards are a usability affordance, never an access control.
DP-IDN-002	P0	Administrative access to CONFIDENTIAL_DEAL content MUST be break-glass: time-boxed, reason-recorded and notified to the deal owner. Broad default administrative visibility is a design defect in a confidentiality product.
DP-IDN-003	P0	Advisors MUST operate through explicit per-client mandates with scope and expiry. Multi-account management MUST NOT be implemented as shared credentials.
DP-IDN-004	P0	Third-party experts MUST be scoped to the specific certification file they were

ID	P	Requirement
		selected for, with access expiring on submission of their report.

CONFIDENTIAL • NOT TO BE DISTRIBUTED

5. Domain model and data

Entities, the fields that carry regulatory weight, and retention.

5.1 Core entities

Entity	Relationships and purpose
Organisation	Holds users, subscription, mandates. Carries the CCIT attribution flag.
User	Belongs to an organisation. Carries role and verification state.
Person	The regulatory unit for disclosure counting: natural or legal person, distinct from account.
Company	The transaction target. One RegistryRecord .
Deal	One AssetDealDetail or one ShareDealDetail . Many Disclosure , DealEvent .
Disclosure	Person to deal, at a tier. Append-only. Drives the RPS counter.
NdaInstance	One SignatureEvidence .
DataRoom	Many Document , each with many DocumentView .
Mandate	Advisor to client, scoped and dated. Separately, seller to licensed partner.
Certification	Deal-Ready record against a company: scope, decision, officer, expiry, revocation.
DistressCase	One to one with a deal. Carries the conciliation link and confidentiality regime.
Event	Deal-Connect: booths, meeting slots, ticketing, sponsorship.
Subscription	Tier, period, entitlements, payment state.
FeeEvent	Transaction fee computation: basis, tier rate, minimum applied, share split.
RevenueShareEntry	Net revenue by category, eligibility test result, computed retrocession, period.
RegulatoryLogEntry	Append-only, hash-chained.

5.2 Fields carrying regulatory weight

Deal

Field	Type	Class	Note
dealType	enum	INTERNAL	ASSET_DEAL or SHARE_DEAL . Immutable after creation.
visibility	enum	INTERNAL	DRAFT , OPEN , RESTRICTED_CIRCLE ,

Field	Type	Class	Note
			INVITE_ONLY, CLOSED.
sectorCode	string	PUBLIC	Controlled vocabulary.
regionCode	string	PUBLIC	Coarse: Grand Lomé, Maritime, Plateaux, Centrale, Kara, Savanes.
turnoverBand	enum	PUBLIC	Bands only. Never exact figures below T2.
askingPrice	integer XOF	CONFIDENTIAL_DEAL	T2 only. Never serialised below T2.
valuationBasis	text	CONFIDENTIAL_DEAL	T2 only. MUST name the method and its source.
disclosureCount	integer	INTERNAL	Maintained by the RPS. Not writable by application code.
circleCap	integer	INTERNAL	Default 50.

ShareDealDetail

Field	Class	Note
legalForm	INTERNAL	Drives DP-RPS-003.
apeEligible	INTERNAL	Derived: true only where legal form is SA and authorisation status is confirmed.
securityType	CONFIDENTIAL_DEAL	ACTIONS or PARTS_SOCIALES .
stakePercent	CONFIDENTIAL_DEAL	T2 only.
transferRestrictions	CONFIDENTIAL_DEAL	*Clauses d'agrément*, pre-emption rights. These frequently block SME share transfers in practice and MUST be surfaced early.

Disclosure — the compliance-critical table

Field	Note
dealId, personId	Person, not account.
tier	T0, T1 or T2 .
grantedAt, grantedBy	Reviewer identity mandatory at T1 and above.
basis	Recorded justification for the grant.
relatedPersonGroupId	Non-null where legally connected to another admitted person. Connected persons count once.
revokedAt	Nullable.

DP-RPS-030 (P0). **Disclosure** MUST be append-only. Revocation sets **revokedAt** or writes a new row: never a delete. The counter derives from active rows grouped by **relatedPersonGroupId**.

SignatureEvidence

Field	Note
method	QUALIFIED_ELECTRONIC or WET_INK_COUNTERSIGNED .
providerRef	Accredited provider transaction reference.
certificateChain	Stored, not merely validated at signing time.
timestampToken	From an accredited timestamping service.
documentHash	SHA-256 of the exact signed artefact.
archiveRef	Accredited archiving reference where DP-VDR-003 applies.

5.3 Registry and attribution

RegistryRecord is populated from the CFE and RCCM channel: **rccmNumber**, **legalName**, **legalForm**, **registrationDate**, **status**, **registeredAddress**, **officers**, **verifiedAt**, **verifiedBy**, **sourceRef**.

ID	P	Requirement
DP-CCI-005	P0	Seller-declared company data MUST be stored separately from registry-verified data, and the interface MUST distinguish the two. Conflating them is how a verification badge becomes a misrepresentation.
DP-FIN-001	P0	Every organisation MUST carry an immutable attribution record : the acquisition channel, the campaign or referral identifier, the timestamp, and the CCIT member-status confirmation reference where applicable. Attribution determines revenue-share eligibility and cannot be reconstructed after the fact, so it MUST be captured at account creation and MUST NOT be editable.

■ Why attribution is a P0 and not an analytics nicety

Retrocession is due only for members whose active status is confirmed, whose account was created through an institutional channel or is identified as such in the platform, and for operations traceable in the platform. Any operation conducted outside the platform or without sufficient traceability falls outside the retrocession perimeter. Attribution capture is therefore a revenue-integrity control, and an untracked signup is unrecoverable revenue.

5.4 Retention

DP-OPS-010 (P0). Every classification MUST have a defined retention period and an automated deletion job. Personal data MUST NOT be kept longer than necessary for the purposes of collection.

Class	Retention	Note
Identity documents	5 years after the relationship ends	Financial-crime baseline. Confirm with counsel.
Data room document bodies	90 days after closure or withdrawal	Then purge. Audit metadata survives.
Data room audit metadata	10 years	Evidentiary value.
NDA and signature evidence	10 years	Limitation-period driven.
Regulatory log	Indefinite	Compliance artefact.
Revenue-share calculation journals	10 years	Must remain reproducible for audit.
Marketing consent records	Until withdrawal plus 3 years	Proof of consent.
Analytics	25 months, aggregated	

DP-OPS-011 (P1). Users **MUST** be able to export their own data in a machine-readable format and request erasure, with the workflow routing to the DPO for assessment against retention obligations. **DP-OPS-012 (P1).** A reversibility export **MUST** be available at the institutional level: aggregated and anonymised usage statistics, certification records and reporting history, in an open format, with a defined three-month transitional continuity period.

6. Lifecycles

State machines. Transitions are validated server-side and logged.

6.1 Deal lifecycle

State	Permitted transitions
DRAFT	→ PENDING_VERIFICATION
PENDING_VERIFICATION	→ VERIFIED · → VERIFICATION_REJECTED → DRAFT
VERIFIED	→ LISTED_OPEN (asset deals) · → LISTED_RESTRICTED (share deals)
LISTED_OPEN / LISTED_RESTRICTED	→ ENGAGED · → PAUSED → prior state · → WITHDRAWN (terminal)
ENGAGED	→ DUE_DILIGENCE · → prior listed state
DUE_DILIGENCE	→ NEGOTIATION · → ENGAGED
NEGOTIATION	→ CLOSED_REPORTED (terminal) · → HANDED_OFF (terminal, licensed partner leads) · → ABANDONED (terminal)

ID	P	Requirement
DP-MKT-001	P0	Every transition MUST be written to DealEvent with actor, timestamp, previous state and reason. Invalid transitions MUST return 409 and MUST NOT partially apply.
DP-MKT-002	P0	CLOSED_REPORTED MUST be labelled in the interface as seller-declared. DealPME does not verify closings and MUST NOT present one as verified, since that would imply a transactional role inconsistent with Section 2.2.
DP-MKT-003	P0	Entry into CLOSED_REPORTED MUST create a FeeEvent in PENDING state where the fee module is active, and MUST create one in SUSPENDED state where it is not, so that no completion is silently lost.

6.2 Investor admission to a share-deal circle

State	Meaning
INTERESTED	Expressed interest from T0.
IDENTITY_VERIFIED	DP-IDN-020 checks passed.
QUALIFICATION_SUBMITTED	Declared status and supporting evidence provided.
UNDER_REVIEW	With the compliance operator.
ADMITTED	RPS increments the counter. T1 unlocked.
WAITLISTED	Cap reached.

State	Meaning
REFUSED	Reason recorded.
NDA_EXECUTED → T2_GRANTED	Full disclosure unlocked, scoped and dated.
REMOVED	Counter decremented. Reason logged.

DP-RPS-031 (P0). **ADMITTED** MUST NOT be reachable by an automated rule alone. A human compliance decision MUST be recorded for every share-deal admission. This is deliberately unscalable: the perimeter defence depends on a human in the loop, and pilot volumes make it affordable.

6.3 Data room access

NO_ACCESS → **NDA_EXECUTED** → **ACCESS_REQUESTED** → **ACCESS_GRANTED** → **ACCESS_EXPIRED** or **ACCESS_REVOKED**.

DP-VDR-010 (P0). Access grants MUST be scoped to a document set and MUST carry an expiry date. Perpetual access MUST NOT be grantable.

7. Functional requirements

By module, with priority. Section 3 requirements are binding and are not repeated here.

7.1 Identity, subscription and billing (IDN)

ID	P	Requirement
DP-IDN-010	P0	Email and password with a second factor. The second factor MUST support one-time codes by SMS, since authenticator-app penetration is low in the target population.
DP-IDN-011	P0	Telephone verification by one-time code at registration.
DP-IDN-012	P0	Account types: natural person, legal person, advisor, institution. Legal persons MUST supply a representative and evidence of that person's authority.
DP-IDN-013	P0	Identity document upload with server-side malware scanning, encrypted storage, never served from a public URL.
DP-IDN-014	P0	Human review queue for verification, recording decision, reviewer identity and reason.
DP-IDN-015	P1	Session management: configurable idle timeout, default 30 minutes for accounts with data room access; device list; remote revocation.
DP-IDN-016	P0	Granular consent at registration: terms, privacy notice and, separately , commercial communications. Bundled consent MUST be rejected by validation.
DP-IDN-017	P1	Account deletion request routed to the DPO with retention assessment.

7.1.1 Subscription tiers

Four tiers, priced in FCFA per month. Entitlements **MUST** be enforced server-side from a single entitlement service and **MUST NOT** be duplicated in feature code.

Capability	Starter 15 000	Business 50 000	Premium 150 000	Elite 300 000
Tax compliance	Standard alerts	Simplified filing	Expert assistance	Unlimited, multi-site
Legal-Tech OHADA	1 document / month	5 documents / month	Unlimited access	Unlimited plus counsel review
B2B networking	Visitor	Standard exhibitor	VIP exhibitor	Principal sponsor
Alerte & Rebond	Self-diagnostic	Asset listing	Crisis unit	Restructuring mandate
Guichet Diaspora	—	Consultation only	Introductions, 5 / month	Unlimited data room access
Label Deal-Ready	—	—	Audit included	Priority plus video
Pass Transmission	—	—	Listing access	Exclusive

Capability	Starter 15 000	Business 50 000	Premium 150 000	Elite 300 000
				mandate

ID	P	Requirement
DP-IDN-040	P0	Entitlements resolved from one service, versioned, with an audit trail on change.
DP-IDN-041	P0	Prepaid billing periods with renewal prompts, not card-style recurring debits. Recurring mobile-money debits are natively supported by only a subset of operators, and aggregator subscription modules remain immature. Building recurring revenue on the least reliable local capability is the most probable commercial failure mode in this plan.
DP-IDN-042	P0	Grace period with progressive degradation on non-renewal: read-only, then teaser-only, then suspended. Data MUST NOT be deleted on lapse.
DP-IDN-043	P0	Invoices MUST carry the taxpayer identification number and comply with local invoicing requirements.
DP-IDN-044	P1	Promotional pricing supported, with retrocession computed on the amount actually collected after promotion.
DP-IDN-045	P1	Manual invoice-and-transfer payment path for the top tier and for institutions. Diaspora and corporate payers will not settle from a mobile wallet.

7.2 Marketplace and matching (MKT)

ID	P	Requirement
DP-MKT-010	P0	Listing wizard branching on deal type at step one, with different field sets and different disclosure warnings per branch.
DP-MKT-011	P0	Server-side tier enforcement per DP-RPS-011 and 012 on every read path, including exports and notifications.
DP-MKT-012	P0	Search and filter over T0 and T1 fields only: sector, region, turnover band, deal type, certification status.
DP-MKT-013	P1	Saved searches with opt-in alerts. Alert payloads MUST NOT exceed the recipient's entitled tier and MUST NOT contain price for share deals.
DP-MKT-014	P1	Rule-based matching on sector, band, region and stated thesis. No machine-learning model in v0: an unexplainable recommendation that turns out to be a solicitation is indefensible.
DP-MKT-015	P1	Every match MUST carry a human-readable reason string shown to the recipient.
DP-MKT-016	P0	Seller dashboard: views by tier, admission queue, disclosure counter with remaining capacity.
DP-MKT-017	P1	In-platform messaging with attachments blocked before NDA execution, retention per 5.4, and export to the evidence pack.
DP-MKT-018	P0	Financial figures MUST render with an explicit "declared by the seller, unaudited" label unless a certification covers them.

ID	P	Requirement
DP-MKT-019	P1	Summary financial assessment MUST be labelled indicative and non-binding, MUST name its method, and MUST NOT be presented as DealPME's opinion of value.
DP-MKT-020	P1	Watchlist and secure appointment booking for the Guichet Diaspora surface.

7.3 Virtual data room (VDR)

ID	P	Requirement
DP-VDR-020	P0	Documents encrypted at rest and never served from a public or guessable URL. Access through short-lived pre-signed URLs bound to an authenticated session.
DP-VDR-021	P0	Server-side rendered view. The original file MUST NOT reach the browser where download is not permitted.
DP-VDR-022	P0	Dynamic watermark on every rendered page: viewer name, account identifier, timestamp, deal reference.
DP-VDR-023	P0	Per-document download permission, default off, grantable by the seller and revocable.
DP-VDR-024	P0	Audit trail: who viewed which document, which pages, when, for how long, from which address and client.
DP-VDR-025	P0	Structured folder tree with a default OHADA due-diligence skeleton: corporate, financial, tax, employment, contracts, assets, litigation, permits.
DP-VDR-026	P1	Question and answer module threaded per document, with seller-controlled visibility and full logging.
DP-VDR-027	P1	Bulk upload with malware scanning and optical character recognition, since a large share of SME records will arrive as photographs.
DP-VDR-028	P0	The viewer MUST function on a 3G connection: progressive page loading, page-level rather than document-level fetch, configurable image quality ceiling.
DP-VDR-029	P0	Access revocation effective within 60 seconds, including invalidation of outstanding pre-signed URLs.

■ On protection claims

A watermark **attributes** a leak. It cannot prevent one: a photograph of a screen defeats every client-side control, and so does any operating-system capture tool. Interface copy, agreements and sales material **MUST** therefore describe the data room as providing deterrence, attribution and contractual recourse, never prevention. Warranting prevention creates an exposure the architecture cannot discharge, and does so precisely where the liability ceiling is lowest.

7.4 Document generation (LEG)

ID	P	Requirement
DP-LEG-001	P0	Template engine producing, in Togo-specific variants: NDA, letter of intent, simplified shareholders' agreement, share purchase agreement, asset purchase agreement, model employment contract.
DP-LEG-002	P0	Templates versioned. Every generated document records the template version and the reviewing counsel reference.
DP-LEG-003	P0	Every generated document MUST carry a prominent notice that it is a drafting aid requiring review by a qualified professional and is not a substitute for personalised legal advice. Communication material MUST carry the same standard warning.
DP-LEG-004	P0	Employment contract templates MUST be labelled as governed by the Togolese Labour Code and applicable collective agreements, not by an OHADA uniform act . Labour law is not harmonised at OHADA level, so presenting these as "OHADA-compliant" would be inaccurate.
DP-LEG-005	P0	Where a template concerns a share transfer, generation MUST read transferRestrictions and warn about approval clauses and pre-emption rights.
DP-LEG-006	P1	Generated documents flow directly into the signature process, with the document hash bound to the signature evidence.
DP-LEG-007	P2	Additional templates added only with recorded counsel review, per template, per jurisdiction.

7.5 Alerte & Rebond (REB)

Requirements DP-REB-001 to 005 are stated in Section 3.7. In addition:

ID	P	Requirement
DP-REB-010	P0	Distress listings default to INVITE_ONLY and MUST never appear in open search.
DP-REB-011	P0	A closed turnaround-investor register, admission by compliance decision only, with an explicit confidentiality undertaking captured per member.
DP-REB-012	P1	Signposting to the statutory procedures, with a referral path to a *mandataire de justice*, presented as information and not as advice.
DP-REB-013	P1	Bank asset listings supporting distinct categories: receivable portfolios, real property, equipment, vehicle fleets, each with its own field set.
DP-REB-014	P0	An operator kill switch withdrawing a distress listing immediately across all surfaces and caches.
DP-REB-015	P1	Crisis-unit and restructuring-mandate workspaces for the upper tiers, with expert access scoped and dated.

7.6 Deal-Connect (CNX)

ID	P	Requirement
DP-CNX-001	P0	Event creation with sessions, exhibitor booths and a participant register, operated by the institutional partner.
DP-CNX-002	P0	Booth pages: company profile, catalogue attachments, contact request. No securities content of any kind. This surface stays entirely outside the perimeter.
DP-CNX-003	P1	Scheduled one-to-one meetings with mutual opt-in, calendar invitations and a rule-based suggestion list.
DP-CNX-004	P1	Embedded video for scheduled meetings, selected on graceful degradation rather than maximum resolution.
DP-CNX-005	P0	Video MUST degrade to audio automatically. On typical local mobile connections, video-first is a failure mode rather than a feature.
DP-CNX-006	P1	Ticketing and sponsorship per event, with revenue categorised for reporting.
DP-CNX-007	P1	Post-event report: attendance, meetings held, contact requests, satisfaction.

7.7 Institutional console (CCI)

ID	P	Requirement
DP-CCI-001	P0	A dedicated institutional workspace with its own role set and its own audit trail, separate from platform administration.
DP-CCI-002	P0	Certification workflow: application, evidence checklist, officer review, decision, expiry, renewal and revocation with reason .
DP-CCI-003	P0	Certification MUST carry a scope statement declaring exactly what was verified (existence, registration, document completeness) and explicitly what was not (financial accuracy, solvency, absence of litigation). An unscoped badge transfers a misrepresentation risk to the institution that issues it.
DP-CCI-004	P0	Registry verification against the RCCM through the CFE channel, storing the source reference and verification timestamp.
DP-CCI-006	P0	Certification decisions MUST be made by a named officer. Automated award MUST NOT be possible. Criteria, expert selection and grant or withdrawal decisions belong to the institution alone; the platform records and executes them.
DP-CCI-007	P0	Member-status confirmation interface: the institution confirms active status; the platform stores the confirmation reference and timestamp against the organisation. The platform MUST NOT hold or ingest the institutional membership database.
DP-CCI-008	P0	Separation of duties. An officer who programmes an event, or who has declared an interest in a listed company, MUST NOT be able to decide that company's certification. Enforce by conflict declaration and assignment rule.
DP-CCI-009	P1	Aggregate dashboard: members onboarded, listings by sector and region, certifications issued and revoked, events held, transactions reported. Aggregate only, with no drill-down into confidential deal content.

■ The membership database constraint

The institutional membership database is **not** transmitted to the platform. Acquisition therefore works one way only: the institution communicates to its members, and members register themselves. There is no bulk import path. This is the single most important constraint on the adoption model and is why Section 13 treats attribution and conversion instrumentation as launch-blocking.

7.8 Fees, revenue share and reporting (FIN)

This module carries the commercial model. It is also the module most likely to be audited, so it **MUST** be built to be recomputed independently.

7.8.1 Revenue categories and split

Revenue category	Billing source	Platform	Institution
SaaS subscriptions	Platform access, tax module, Legal-Tech	90 %	10 %
B2B events	Ticketing and sponsorship	90 %	10 %
Certification	Audit fees for the Deal-Ready label	50 %	50 %
Transmission and disposal	Success fees on business disposals	70 %	30 %
Distressed disposals	Success fees on asset sales and restructuring	70 %	30 %

7.8.2 Transaction fee schedule

Transaction size	Premium tier rate	Elite tier rate	Split
0 to 50 M FCFA	8 %	6 %	70 / 30
51 to 250 M FCFA	6 %	5 %	70 / 30
251 M to 1 bn FCFA	5 %	4 %	70 / 30
Above 1 bn FCFA	4 %	3 %	70 / 30

A guaranteed minimum fee of 1 500 000 FCFA applies at Premium tier to cover data room structuring. All of this is subject to the activation gate at DP-RPS-021.

ID	P	Requirement
DP-FIN-010	P0	Implement net revenue as a computed value with a stored audit breakdown: gross collected, less tax, refunds, cancellations, credits, discounts, chargebacks and unpaid items, less payment processing costs, less amounts passed to third parties where the platform acts only as collector.
DP-FIN-011	P0	Compute retrocession per revenue category, per period, applying the eligibility test in DP-FIN-001. Ineligible revenue MUST be reported separately with the reason for exclusion, never silently dropped.

ID	P	Requirement
DP-FIN-012	P0	Persist a calculation journal for every retrocession line: inputs, rates applied, exclusions applied, intermediate values, output, code version and timestamp. The journal MUST allow an independent party to recompute the figure without access to source code or algorithms.
DP-FIN-013	P0	Institutional reporting dashboard, continuously updated: registrations, transaction volume, conversion rate, net revenue by service category and computed retrocession.
DP-FIN-014	P0	Quarterly consolidated report generated automatically and archived immutably, with a 30-day dispute window tracked in the system and a recorded deemed-acceptance state on expiry.
DP-FIN-015	P0	Retrocession settlement on a quarterly cycle, supporting set-off against amounts owed in the other direction, with the set-off itemised.
DP-FIN-016	P0	A scoped audit export covering calculation journals and retrocession traceability. The export MUST NOT expose source code, algorithms, or any other client's data.
DP-FIN-017	P1	Freeze or cancel retrocession on established fraud or abuse, with reason and approver recorded.
DP-FIN-018	P1	Notify a material pricing change to the institutional partner with at least one week's notice, recorded in the system.

7.9 Operations (OPS)

ID	P	Requirement
DP-OPS-020	P0	Structured logging with correlation identifiers. Logs MUST NOT contain confidential deal content or identity document data.
DP-OPS-021	P0	Error tracking, uptime monitoring and alerting to an on-call route. Because the availability and response targets in Section 10 are commitments on outcome, monitoring is load-bearing rather than advisory.
DP-OPS-022	P0	Automated encrypted backups with a restore test executed and documented before launch . An untested backup is not a backup.
DP-OPS-023	P0	Feature flags for every module, so a compliance concern can disable a surface without a deployment.
DP-OPS-024	P1	Immutable administrative action log, reviewable under the institutional audit right within the scope set by DP-FIN-016.
DP-OPS-025	P1	Support ticketing with severity classification matching Section 11.2, a documented escalation path and response targets.
DP-OPS-026	P1	Planned maintenance scheduling with automated advance notification to the institutional partner and to affected users.

8. Integration specification

External providers, and the abstraction rule that keeps them replaceable.

■ Architectural principle

Every external provider sits behind an internal adapter interface. No provider-specific type, field name or error code may appear in domain code. In this market providers change: at least three of the categories below have no long-term certainty.

8.1 Payments

Togo counts more than 6 million active mobile money accounts in a population of around 9 million, a penetration rate above many regional peers. T-Money (Togocom, now Mixx by Yas) is the historical leader at roughly half the market, with merchant collection fees of about 1 to 1.5 %, and the Togocom API is available to companies registered in Togo. Flooz (Moov Africa Togo) holds roughly 40 %. Gozem Money, operator of the local super-app, is the third player. Mobile money is the principal rail: the bank account remains a minority instrument while nearly everyone holds a mobile wallet.

Aggregator	Coverage	Indicative commission	Note
CinetPay	Best established locally: T-Money, Flooz, cards	1.8 to 2.2 %	French dashboard, reliable webhooks
PayDunya	Togo since 2023: T-Money, Flooz	1.5 to 2 %	SDKs in several languages, French documentation
Hub2	Broadest local coverage; integrated Gozem Money in 2026; multi-country from one contract	2 to 2.5 %	Cleanest path to later regional expansion
PayGate Global	Local: Flooz and T-Money	Free account and API	Settlement asymmetry: Flooz available daily, T-Money remitted every 10 days
Gozem Pay direct	Gozem Money	0.8 %	For high volume

ID	P	Requirement
DP-OPS-030	P0	Primary aggregator SHOULD be Hub2 (breadth plus regional optionality) or CinetPay (deepest local establishment), with a second provider configured as failover behind the same adapter.
DP-OPS-031	P0	The billing ledger MUST model settlement lag per rail. With one rail remitting daily and another on a ten-day cycle, a "payment received equals cash available" assumption misstates the cash position and breaks reconciliation. Model authorised , captured , settled and reconciled as distinct states with distinct timestamps.
DP-OPS-032	P0	Card acceptance available for diaspora and institutional payers alongside mobile

ID	P	Requirement
		money.

8.2 Other integrations

Category	Requirement
Identity verification	DP-IDN-050 (P0) . Document capture, human review, one-time code and registry cross-check. No biometric provider. If a provider is used for document authenticity only, its agreement MUST confirm no biometric template is created, and the transfer position MUST be covered by gate G2.
Electronic signature	DP-VDR-030 (P0) . Provider qualified and accredited under the Togolese framework, or an international provider recognised under the third-country recognition provisions. Verify against the regulator's current position before contracting. DP-VDR-031 (P0) . Obtain and file the provider's professional liability insurance certificate.
Company registry	DP-CCI-010 (P0) . Integration with the CFE and RCCM channel, delivering three capabilities: verification of legal form, status and officers; origination from newly formed companies; and a distress signal from dissolution announcements. DP-CCI-011 (P0) . If no API exists, specify a supervised file exchange or operator lookup rather than deferring the capability: verification is the core value and MUST NOT depend on an API that may never be built.
Tax module	DP-LEG-020 (P1) . Third-party partner module for simulation, simplified filing and certificates, integrated behind a feature flag. The platform is responsible for the quality of the technical integration; the partner is responsible for the tax content generated, and the interface MUST state this. Users remain solely responsible for the accuracy of their declarations.
Object storage	DP-VDR-032 (P0) . Server-side encryption, versioning, access logging, lifecycle policy implementing Section 5.4. Public access denied at account level, asserted by an automated pipeline check.
Video	DP-CNX-010 (P1) . Embedded real-time provider with mandatory audio fallback.
Messaging	DP-OPS-034 (P0) . Transactional email and SMS through separate providers, with SMS primary for time-critical notifications. Every non-transactional message MUST check the consent record before dispatch and MUST include one-click unsubscribe.

9. Engineering conventions

The decisions that would otherwise be made a hundred times, inconsistently, by whoever reaches the file first.

This section exists to remove ambiguity, not to impose taste. Every convention below closes a question that would otherwise surface in code review, in a production incident, or in a reconciliation dispute.

9.1 Repositories and environments

Convention	Rule
Repository	Single repository. Applications under apps/ , shared libraries under packages/ . The regulatory perimeter service lives in its own application boundary (apps/rps) so its dependencies and its deployment can be reviewed independently.
Branching	Trunk-based. Short-lived branches, squash merge. Release from trunk with a tag.
Environments	local , dev , staging , production . Configuration by environment variable only; no environment-specific code paths.
Test data	Production personal data MUST NOT be copied into any non-production environment. Seed from the synthetic dataset in 9.6. This is a data protection obligation, not a hygiene preference.
Pull requests	Every pull request MUST reference at least one requirement identifier. Work that maps to no DP - identifier is either scope creep or a missing requirement, and both need resolving before merge rather than after.

9.2 API conventions

Aspect	Rule
Style and versioning	REST over JSON. Path-versioned at /v1 . Breaking changes create /v2 ; fields are added, never repurposed.
Casing	camelCase in JSON payloads, snake_case in the database. The mapping happens in one place, not per handler.
Pagination	Cursor-based, ?cursor=&limit= , default limit 25, maximum 100. Offset pagination MUST NOT be used on deal or disclosure collections, where rows shift under the reader.
Idempotency	Every state-creating POST accepts an Idempotency-Key header and MUST return the original response on replay. This is mandatory rather than optional for payment and webhook endpoints: mobile money callbacks are retried, and a duplicated fee event is a reconciliation dispute.
Correlation	Every request carries X-Correlation-Id , generated at the edge if absent, propagated to every log line and every outbound call.
Time and money in payloads	Timestamps as ISO 8601 with Z . Monetary amounts as integers with an

Aspect	Rule
	explicit currency field. Never a float, anywhere, for any reason.

9.2.1 Error taxonomy

A single error envelope: { "error": { "code", "message", "details", "correlationId" } }. **code** is machine-readable and stable; **message** is human-readable and localised.

Code	HTTP	Meaning
VALIDATION_FAILED	422	Payload rejected. details carries field-level errors.
UNAUTHENTICATED	401	No valid session.
FORBIDDEN	403	Authenticated but not permitted for this resource.
PERIMETER_BLOCKED	403	Refused by the regulatory perimeter service. Distinct code, always, with a reason in details .
CONSENT_REQUIRED	403	Action requires a consent the user has not granted.
NOT_FOUND	404	Also returned instead of 403 where confirming existence would itself disclose information about a restricted deal.
STATE_CONFLICT	409	Invalid lifecycle transition, or a stale write.
RATE_LIMITED	429	With Retry-After .
UPSTREAM_UNAVAILABLE	502	A provider adapter failed. details names the adapter, never the provider's raw error.
INTERNAL	500	Unhandled. Never leaks a stack trace or a query.

■ Why the perimeter refusal needs its own code

A compliance block is not a bug and must never surface to the user as a generic failure. **PERIMETER_BLOCKED** lets the interface explain what happened, lets support triage it without a developer, and lets the regulatory log correlate refusals to deals. Collapsing it into **FORBIDDEN** destroys all three.

9.3 Data conventions

Aspect	Rule
Identifiers	UUIDv7 for all primary keys: time-ordered, so index locality is preserved without exposing a sequence.
Money	Store XOF as a plain integer number of francs. The West African CFA franc does not use subunits in practice, so there are no centimes to hold. Most payment libraries assume amounts in minor units and will silently multiply or divide by one hundred. Every adapter MUST normalise at its

Aspect	Rule
	boundary, and the normalisation MUST be covered by a test.
Timestamps	timestamp_{tz} , stored in UTC. Togo observes UTC+0 year-round with no daylight saving, so display equals storage locally, but storage stays UTC so that diaspora users in other zones render correctly.
Telephone	E.164, stored with the country code. Default +228 on input, never assumed on storage.
Enumerations	SCREAMING_SNAKE_CASE , identical in the database and the API, never localised. Display labels live in the translation files.
Deletion	Hard delete only when fulfilling an erasure request. Everywhere else, retention rules in 5.4 govern, and append-only tables are never deleted from.
Migrations	Forward-only, one migration per pull request, reversible within the same release. Every migration creating a column MUST record its data classification in a comment , so 3.5.2 is enforced at the point of creation rather than audited afterwards.
Currency display	Formatting is a presentation concern. The API returns integers; the interface applies the rules in Section 12.

9.4 Security defaults in code

- Deny by default. A new endpoint without an explicit policy **MUST** fail closed, and the test suite **MUST** assert that an unlisted role receives **FORBIDDEN**.
- Row-level security on every deal-scoped table. Authorisation predicates live at the data layer, never assembled in a handler.
- No dynamic SQL string construction. Parameterised queries or a query builder, without exception.
- Secrets from the managed store at runtime. Nothing in the repository, nothing in the image, nothing in an environment file committed by accident.
- Confidential fields are encrypted at the application layer before they reach the database, so a database-level compromise does not yield deal content.

9.5 Observability and release

Aspect	Rule
Logging	Structured JSON, one event per line, always carrying correlationId , actorId and requirementContext where a compliance-relevant action occurred. Never confidential deal content, never identity document data.
Metrics	Every P0 requirement with a measurable target in Section 11 has a corresponding dashboard panel and alert. A target with no alert is an aspiration.
Feature flags	Named module.capability , for example rps.share_deals or fin.transaction_fees . Flags controlling a compliance gate MUST be settable only by a named role and MUST log every change.

Aspect	Rule
Releases	Every release carries notes listing the requirement identifiers delivered. This is what makes the institutional reporting in 7.8 defensible.
Rollback	Every deployment is revertible within 15 minutes without a database restore. Migrations that cannot satisfy this ship in two releases: expand, then contract.

9.6 Testing and the canonical dataset

Layer	Expectation
Unit	Business rules, fee computation, tier field suppression, net revenue calculation.
Integration	Every authorisation policy, including negative cases. Every lifecycle transition, including invalid ones.
Contract	Each provider adapter tested against recorded fixtures, including replayed and out-of-order webhooks, and a duplicate callback.
End to end	The critical paths in Annex C, run on every release.
Mandatory	Every P0 requirement in Section 3 has at least one automated test. A compliance control asserted only in prose is a control that will regress.

A canonical seed dataset **MUST** ship with the repository and **MUST** be the basis of every demonstration: two sellers, one asset deal and one share deal in a SARL, one certified company and one uncertified, four investors of whom two are legally connected to each other, one bank counterparty, one distressed case linked to a conciliation, and one completed event. Building against a shared, deliberate dataset is what makes a demonstration reproducible and a bug report intelligible.

9.7 Documentation that ships with the code

- An OpenAPI description generated from the implementation, not hand-maintained alongside it.
- A one-page runbook per module: what it does, what it depends on, how it fails, who is called.
- An architecture decision record for every deviation from this document, recording the requirement affected, the reason and the approver. This is the mechanism by which Section 1.3 stays true in practice.

10. Security architecture

Controls, isolation, and an honest statement of what cannot be controlled.

10.1 Cryptography and secrets

ID	P	Requirement
DP-OPS-040	P0	TLS 1.3 minimum in transit with strict transport security. AES-256 at rest for object storage and database volumes. Application-layer encryption for identity documents and confidential deal fields, with keys in a managed key service and a defined rotation schedule. Certificate management and renewal is a platform responsibility.
DP-OPS-041	P0	Passwords hashed with Argon2id or bcrypt at an appropriate cost factor. No custom cryptography anywhere.
DP-OPS-044	P0	No secret in source control. Managed secret store with audited access. Dependency vulnerability scanning in continuous integration, failing the build on critical findings.

10.2 Isolation

ID	P	Requirement
DP-OPS-042	P0	Data room content logically separated from marketplace data, in a distinct schema or database with distinct credentials. A read-only compromise of the marketplace service MUST NOT yield data room documents.
DP-OPS-043	P0	Every query on deal-scoped data MUST be constrained by an authorisation predicate applied at the data layer, not assembled in application code. Row-level security is the preferred mechanism.

10.3 Data room threat model

Stated honestly, because the value of the disclosure is precisely that it is not marketing.

Threat	Mitigation available	Residual	Disclosed?
Unauthorised access by a non-signatory	NDA gate, scoped grants, expiry, second factor	Low	—
Bulk download and redistribution	Download off by default, server-side rendering	Low	—
Screenshot on device	Watermark provides attribution only	High, unmitigable	Yes
Photograph of the screen	None	High, unmitigable	Yes
Copy and paste of rendered text	Image rendering removes the text layer	Medium	—

Threat	Mitigation available	Residual	Disclosed?
Credential sharing between colleagues	Device list, concurrent session limit, anomaly alert	Medium	Yes
Insider access by platform staff	Break-glass access, logging, owner notification	Low	Yes
Leak after legitimate access	NDA, evidence pack, structured escalation	Medium	Yes

DP-VDR-033 (P0). The seller-facing interface MUST present this model in plain language before first upload. A seller who understands that the protection is attribution rather than prevention makes better disclosure decisions and has no claim when a leak occurs.

DP-OPS-045 (P0). Independent penetration test before launch, with authorisation bypass on tier enforcement, pre-signed URL handling and RPS counter manipulation as explicit scope items. Regular vulnerability testing and prioritised patch management thereafter.

11. Service levels and non-functional requirements

Measurable targets with a stated reference environment and test method.

11.1 Availability

Parameter	Commitment
Monthly availability	99.5 %, excluding planned maintenance windows and the exclusions below
Planned maintenance	Up to 4 hours per month, preferably off-peak, notified at least 48 hours in advance except for security emergencies
Exclusions	Third-party telecom operator incidents; force majeure; attacks exploiting compromised credentials; misconfiguration on the partner side; third-party module failures
Recovery objectives	RPO 1 hour, RTO 4 hours, both demonstrated by a documented restore test

11.2 Support severity and response

Severity	Definition	Acknowledgement	Resolution
P1 — critical	Platform unavailable for the majority of users	4 working hours	Workaround within 2 working days
P2 — major	Principal function degraded with no workaround	1 working day	Correction within 5 working days
P3 — minor	Non-blocking defect with an available workaround	2 working days	Next release
P4 — request	Question, assistance, functional request	3 working days	Scheduled by backlog or quotation

Standard support hours are working days, 09:00 to 17:00 GMT. Level 1 covers intake, qualification and resolution of access and routine usage problems; level 2 covers deep technical diagnosis, correction of application defects and coordination with development. Advanced user training, personalised legal or tax support, member-specific configuration and bulk data imports fall outside the standard scope.

11.3 Reference environment

Performance targets are meaningless without a stated environment.

Parameter	Reference value
Reference device	Mid-range Android, 4 GB RAM, current browser minus one version
Reference network	HSPA / 3G, 1.5 Mbps down, 0.5 Mbps up, 300 ms round trip, 1 %

Parameter	Reference value
	packet loss
Secondary reference	Fixed broadband, 10 Mbps, 60 ms round trip
Measurement	Synthetic monitoring from a Lomé vantage point plus real-user monitoring at the 75th percentile

11.4 Performance and capacity

ID	P	Requirement	Test method
DP-OPS-050	P0	Marketplace search: largest contentful paint at or below 4.0 s at the 75th percentile on the reference network	Real-user monitoring, 7-day window
DP-OPS-051	P0	API read endpoints: 95th percentile at or below 800 ms server-side	Application performance monitoring
DP-OPS-052	P0	Data room first page render at or below 6.0 s at the 75th percentile; subsequent pages at or below 2.0 s	Real-user plus synthetic
DP-OPS-053	P0	Initial JavaScript payload at or below 250 KB compressed on marketplace routes	Build-time budget, enforced in CI
DP-OPS-054	P1	Document upload resumable after interruption	Manual test with forced disconnect
DP-OPS-057	P0	Pilot capacity: 2 000 registered accounts, 300 concurrent sessions, 200 active deals, 20 000 documents. Do not over-engineer for scale that will not arrive during the pilot: engineering effort belongs in compliance and reliability	Load test at 2× target
DP-OPS-058	P1	Event workloads scale independently, so an event cannot degrade the marketplace	Load test during simulated event

11.5 Accessibility and compatibility

ID	P	Requirement
DP-OPS-060	P1	WCAG 2.1 AA on all core journeys.
DP-OPS-061	P0	Supported: Chrome and Firefox current minus two, Safari current minus one, Chrome Android current minus two. Viewport range 360 to 1920 pixels.
DP-OPS-062	P0	Core read journeys function without layout collapse on slow connections.

12. Localisation

French is the source language, not a translation target.

ID	P	Requirement
DP-OPS-070	P0	French is the source language. English is derived. All interface strings, legal templates, notifications and help content are authored in French first. A specification written in English for a francophone market produces an interface no local business owner will have reviewed.
DP-OPS-071	P0	French typography: narrow non-breaking space before ; : ! ? , French quotation marks with inner non-breaking spaces, lowercase month names, ordinals as 1^{er} and 2^e . No em dashes.
DP-OPS-072	P0	Currency: FCFA without decimals, thousands grouped by non-breaking space, symbol after the amount, as in 1 250 000 FCFA. The fixed parity of 655.957 FCFA to 1 EUR MAY be used for indicative conversion, always labelled as indicative.
DP-OPS-073	P0	Legal terms of art MUST NOT be translated in either version: *appel public à l'épargne*, *fonds de commerce*, *parts sociales*, *clause d'agrément*, *règlement préventif*, *conciliation*, *mandataire de justice*, RCCM, SYSCOHADA.
DP-OPS-074	P1	Dates as JJ/MM/AAAA in French, ISO 8601 in APIs and exports.

13. Adoption and liquidity

A marketplace specification without an adoption plan is a feature list.

13.1 The market, quantified

Company formation in Togo is genuinely dynamic. 13 835 companies were created in 2022, a record against 13 770 in 2021, with 11 659 of the 2022 cohort founded by Togolese nationals. More than 40 000 companies were created between 2010 and 2016. Formation takes under four hours, and Togo ranked 15th globally and 1st in Africa on the Doing Business 2020 *Starting a Business* indicator.

That is a strong formation pipeline. It is not the same as a transmission pipeline. Business transmission volume in a market this size is measured in deals per quarter, not per week. A pilot whose success depends on transmission deal density will read as a failure regardless of build quality.

13.2 What the member evidence says to build first

Institutional survey work on the local private sector identified, alongside financing, a lack of market outlets, difficulty finding partners, and supply difficulties as members' major problems, across a base of roughly 3 700 registered companies at the time.

Those are networking problems rather than transmission problems. They are also the problems with no securities-perimeter exposure whatsoever.

Wave	Surface	Perimeter load	Why in this order
1	Deal-Connect, member onboarding, certification	None	Addresses the documented member pain directly, delivers institutional value immediately, and builds the verified user base that later makes the marketplace viable
2	Asset deals, openly listed	None	Real transaction value with no nullity risk, on a surface that can be publicly marketed
3	Share deals inside the closed circle	Full RPS	Opened only once the verified base exists and the perimeter service is proven in production

■ This is sequencing, not de-scoping

Every module in Section 7 is built. The waves determine the order in which surfaces open to users, so that institutional value lands early while the perimeter machinery is built and legally reviewed.

13.3 Requirements

ID	P	Requirement
DP-CNX-020	P0	Self-registration funnel designed for institutional broadcast: campaign-specific landing pages, referral codes and invitation links that write the attribution record

ID	P	Requirement
		at account creation. There is no bulk member import path (see 7.7), so the funnel is the only acquisition mechanism and its instrumentation is revenue-critical.
DP-MKT-030	P0	Operator-assisted listing creation on behalf of a seller, with the seller's recorded authorisation. Do not assume SME owners will self-serve a first listing.
DP-REB-020	P1	Origination feed from dissolution and liquidation announcements as a supply source for Wave 2.
DP-OPS-075	P0	Liquidity instrumentation from day one: listings by type and wave, verified accounts by persona, teaser to admission conversion, admission to NDA, NDA to data room, time to first counterparty, deals per quarter, and attribution by channel. Without these the pilot cannot be evaluated.
DP-OPS-076	P1	Weekly operator digest of adoption and liquidity indicators, since the pilot will be steered manually.

14. Delivery, build order and governance

Phased, gated, and reviewed monthly.

14.1 Build order and dependencies

Nothing below is optional sequencing. Each row depends on the row above it, and building out of order produces rework rather than progress.

Order	Build	Because
1	Schema, classification, migrations (Sections 5 and 9.3)	Every later decision reads from the data model. Classification applied later is classification applied incompletely.
2	Authentication, roles, server-side policy (4, 7.1)	Nothing can be safely surfaced before authorisation is real.
3	Regulatory perimeter service and its tests (3.3, 3.4)	It constrains what every subsequent surface may render. Building surfaces first means retrofitting suppression into each of them.
4	Institutional console and certification (7.7)	Delivers the Wave 1 value and produces the verified accounts everything else needs.
5	Attribution funnel, subscriptions, billing (7.1.1, 12.3)	Revenue integrity depends on attribution existing before the first account is created.
6	Asset marketplace and messaging (7.2)	First transaction surface, with no perimeter exposure.
7	Signature and data room (3.6, 7.3)	Required before any confidential disclosure can occur.
8	Share deals on the perimeter service (7.2 with 3.4)	Only once the perimeter service is proven in production.
9	Fees, revenue share, reporting (7.8)	Depends on completed transactions existing to compute against.
10	Alerte & Rebond (7.5)	Highest confidentiality regime; build it when the controls it relies on are mature.

14.2 Governance

Mechanism	Cadence and scope
Steering committee	Monthly minimum. Tracks indicators, arbitrates operational priorities, validates communication plans, handles compliance and security matters.
Referents	Each party names an operational referent and a decision referent. Operational referents may validate routine execution decisions but not substantive scope changes.
Acceptance	Specific deliveries are reviewed within 10 working days of availability. Absent written, reasoned reservations in that window, a delivery is

Mechanism	Cadence and scope
	deemed accepted, so the review window MUST be tracked in the delivery tooling with automated reminders.
Change notification	Material changes affecting use of the services are notified with two to eight weeks' notice depending on nature and scale.
Specific development	Any bespoke development, non-standard integration or customisation request is scoped and quoted separately before work begins.

14.3 Phases

Phase	Weeks	Content	Exit
0 — Foundations and compliance	1 to 6	Environments, pipeline, authentication, role skeleton, data classification, IPDCP declaration filed, certification provider selected and validated, counsel opinions commissioned, DPO appointed	G1, G3, G9 closed; G4 and G5 commissioned
1 — Wave 1: institutional layer	5 to 12	Institutional console, certification workflow with scope statements, registry verification, member-status confirmation, self-registration funnel with attribution, subscriptions and prepaid billing, events and booths	Institution can confirm, certify and run one event end to end
2 — Wave 2: asset marketplace	11 to 18	Asset listings, search, T0 and T1 rendering with server-side field enforcement, messaging, NDA generation and qualified signature, data room with honest threat-model disclosure, audit trail	G2, G4, G10 closed; one asset deal completed end to end in staging with a real signature
3 — Wave 3: share deals and perimeter	17 to 26	Regulatory Perimeter Service in full, closed-circle admission with human decision, share listings with legal-form gating, evidence-pack export, dormant partner interface	G5, G6, G7 closed; cap enforcement verified by test
4 — Fees and reporting	21 to 28	Fee engine behind its activation gate, net revenue computation, calculation journals, institutional dashboard, quarterly consolidated reporting, scoped audit export	G8 closed; independent recomputation reconciles
5 — Alerte & Rebond	27 to 34	Distress listings under elevated confidentiality, turnaround register, statutory signposting, institutional counterparty flow as a manual gated process, distress feed	Legal review of conciliation confidentiality controls

14.4 Definition of ready and definition of done

Ready. A requirement enters a sprint only when: its identifier and priority are recorded; its acceptance criteria are written and testable; every field it introduces has a data classification and a retention rule; its authorisation expectations are stated for every role; any external dependency it needs is confirmed available; and it carries no unresolved conflict with Section 3. A requirement that is not ready does not become ready by being started.

Done. A requirement is done when it is implemented; its acceptance criteria are automated where automatable; server-side authorisation is tested including negative cases; French strings are reviewed by a native speaker; classification and retention are applied to every new field; observability and alerting are in place for any measurable target; documentation and the OpenAPI description are current; a release note references the identifier; and, for any requirement in Section 3, legal counsel has signed off.

CONFIDENTIAL • NOT TO BE DISTRIBUTED

Annex A. Risk register

Context for the build team: where this product actually fails, and which requirement answers it.

#	Risk	Severity	Mitigation and owner
R1	Share transaction held void for breach of the public-offering prohibition	Critical • low with the RPS, high without	Sections 3.3 and 3.4; counsel opinion at G5; cap set at half the statutory reference. Owner: Legal
R2	Cross-border transfer authorisation delayed or refused	Critical • blocks launch	File early; prepare in-country hosting fallback for the sensitive subset. Owner: DPO
R3	Transmission deal flow insufficient in Togo alone	High / High	Wave sequencing; asset deals and networking carry the pilot. Owner: Product
R4	Recurring mobile-money billing unreliable	High / High	Prepaid periods; manual invoicing for upper tiers. Owner: Finance
R5	No bulk member import, so acquisition depends entirely on institutional broadcast	High / High	Attribution-instrumented funnel; campaign landing pages; conversion reporting reviewed monthly. Owner: Product
R6	Retrocession figures disputed and not independently reproducible	Medium / High	Calculation journals at DP-FIN-012; scoped audit export; reconciliation at G8. Owner: Finance
R7	Data room leak damages institutional reputation	Medium / High	Honest threat model; qualified signature; evidence pack; structured escalation. Owner: Product and Legal
R8	Certification badge attached to a company that proves fraudulent	Medium / High	Scope statements; named-officer decisions; revocation workflow; separation of duties. Owner: Institution
R9	Signature challenged for lack of the reliability presumption	Medium / High	Accredited provider only; accredited archiving; wet-ink fallback. Owner: Tech lead
R10	No registry API, so verification becomes manual and slow	High / Medium	Supervised fallback specified now at DP-CCI-011. Owner: Tech lead
R11	Availability or response targets missed where the commitment is on outcome	Medium / Medium	Monitoring as load-bearing; maintenance windows notified; exclusions documented per incident. Owner: SRE
R12	Unsolicited-communication breach through matching alerts	Medium / Medium	Consent gate on every dispatch at DP-RPS-014. Owner: Product
R13	Distress listing triggers a borrower's acceleration clause	Medium / High for the client	Mandatory warning and acknowledgement at DP-REB-003. Owner: Legal
R14	Third-party tax module unavailable or unstable	Medium / Low	Feature-flagged; responsibility allocation stated in the interface. Owner: Product

#	Risk	Severity	Mitigation and owner
R1 5	Over-engineering for scale that never arrives	Medium / Medium	Explicit pilot capacity ceiling at DP-OPS-057. Owner: Tech lead

CONFIDENTIAL • NOT TO BE DISTRIBUTED

Annex B. Requirement index

Module	Prefix	Requirements	P0
Identity, subscription, billing	DP-IDN-	23	16
Marketplace and matching	DP-MKT-	15	8
Virtual data room	DP-VDR-	19	16
Document generation	DP-LEG-	8	5
Alerte & Rebond	DP-REB-	13	8
Deal-Connect	DP-CNX-	11	5
Institutional console	DP-CCI-	11	9
Regulatory perimeter	DP-RPS-	21	18
Fees and revenue reporting	DP-FIN-	10	8
Operations	DP-OPS-	35	24

The concentration of P0 requirements in the perimeter, data room and operations modules reflects where the product's legal and commercial risk actually sits. A build plan that sequences by feature attractiveness rather than by this distribution will ship the risk last.

Annex C. Critical-path acceptance tests

The tests that decide whether the build is releasable. Automate all of them; run all of them on every release.

Each is expressed as Given / When / Then and maps to the requirement it protects. A failure in any of these is a release blocker regardless of sprint commitments.

#	Protects	Test
A1	DP-RPS-003	Given a share deal whose target is a SARL, when the seller publishes to the open marketplace, then publication is refused, visibility remains RESTRICTED_CIRCLE , and a regulatory log entry is written.
A2	DP-RPS-012	Given any T1 payload for a share deal, when the response is serialised, then askingPrice , valuation , ebitdaMultiple , offerTerms , companyName and rccmNumber are absent. Asserted for every T1 endpoint, including exports and notification payloads.
A3	DP-RPS-013	Given a T1 share-deal resource, when it is requested without authentication, then the response is NOT_FOUND and the resource appears in no sitemap and no search index.
A4	DP-RPS-015	Given a share deal at its circle cap, when a further admission is attempted, then it is refused, and when a person is removed with a recorded reason, then one further admission becomes possible and both events are logged.
A5	DP-RPS-031	Given a qualified investor meeting every automated criterion, when no human compliance decision has been recorded, then the state never reaches ADMITTED .
A6	DP-RPS-014	Given a user who has not granted marketing consent, when a matching alert is generated, then no message is dispatched and the suppression is logged.
A7	DP-RPS-021	Given the transaction-fee flag is inactive, when a deal enters CLOSED_REPORTED , then a FeeEvent is created in SUSPENDED state and no fee is displayed, invoiced or accrued anywhere.
A8	DP-VDR-029	Given an investor holding a valid pre-signed document URL, when access is revoked, then the URL fails within 60 seconds.
A9	DP-VDR-001	Given an NDA signature flow, when the signature completes, then the stored evidence contains the certificate chain, a timestamp token and the document hash, and the provider reference resolves to an accredited provider.
A10	DP-VDR-002	Given a user who declines electronic signature, when they request the fallback, then a PDF is generated and the deal proceeds on countersignature without any blocked state.
A11	DP-FIN-001	Given an account created through an institutional campaign link, when the account is inspected, then an immutable attribution record exists, and when modification is attempted, then it is refused.
A12	DP-FIN-012	Given a quarterly retrocession figure, when an independent party recomputes it from the calculation journal alone, then the result reconciles exactly, without access to source code.
A13	DP-OPS-031	Given a mobile money callback delivered twice, when both are processed, then exactly one settlement is recorded and the ledger reconciles.

#	Protects	Test
A14	DP-IDN-002	Given an administrator opening confidential deal content, when the access occurs, then it is time-boxed, a reason is recorded, and the deal owner is notified.
A15	DP-REB-002	Given a listing linked to an ongoing conciliation, when any surface is rendered, then it appears in no public or search result at any tier, and every view is logged including administrative views.
A16	DP-OPS-022	Given the production backup, when a restore is performed into a clean environment, then the application starts and the canonical dataset validates. Executed and documented before launch, then quarterly.

Annex D. Working with a coding agent

This document is written to be pasted. This annex explains how, and where the practice goes wrong.

A coding agent is only as good as the context it receives, and its most expensive failure mode is not error but confident invention. The constraints in Section 3 are exactly the kind of thing an agent will smooth over if it is asked to build a feature without them.

D.1 Guardrail preamble

Prepend the following to every build session, before any module context.

■ Preamble to prepend

You are implementing a specified system. The specification is authoritative. Where the specification is silent, stop and ask rather than choosing. Never infer a business rule, a permission, a monetary calculation or a disclosure rule that is not written down. Never relax a constraint marked MUST or MUST NOT. Money is an integer number of XOF with no subunit. All authorisation is server-side. If a requested feature appears to conflict with Section 3, halt and report the conflict instead of resolving it.

D.2 Context order

Supply context in this order. Do not paste the whole document: an agent given sixty pages will weight the last section it read.

Step	Paste	Then ask for
1	Sections 9 and 5	The schema and migrations only. Review before proceeding.
2	Sections 3.3, 3.4 and 6	The regulatory perimeter service, with its tests. Build this before any user-facing surface.
3	Section 4 and the relevant part of 7	One module. Never more than one module per session.
4	Annex C entries relevant to that module	The tests, written before or alongside the implementation.
5	Section 11	Performance and observability work, once the module functions.

D.3 What the agent must never be left to decide

- Which fields appear at which disclosure tier. Always paste the tier table; never summarise it.
- Any monetary rate, threshold or minimum. These are in 7.8 and are not to be recalled from context.

- Whether an action needs a human decision. If Section 3 says a human decides, no automation may substitute.
- Retention periods and deletion behaviour.
- Anything in Section 2.2, which constrains the words the interface may use.

▲ The failure mode to watch for

An agent asked to "add search filters" will helpfully surface price, because price is a natural filter and the request did not forbid it. That single well-intentioned addition converts a compliant teaser into an offer to the public. Review every change against the tier table, and rely on test A2 rather than on reading the diff.

D.4 Review discipline

Agent-generated work is reviewed against the requirement identifier it claims to implement, not against whether it runs. The two questions at review are: does this satisfy the acceptance criteria as written, and does it introduce any behaviour the specification does not describe. The second question catches more defects than the first.

Annex E. Legal and regulatory sources

OHADA

AUSCGIE, articles 81 to 96 on *appel public à l'épargne*, including article 82 on nullity, article 83 on the definition of an offer to the public and article 385 on the société anonyme. AUDCG on *cession de fonds de commerce* and on electronic documents. AUPCAP as revised on 10 September 2015: conciliation at articles 5-1 and following, simplified procedures, *petite entreprise* defined at article 1-3, *mandataires de justice* at articles 4-1 to 4-23.

Regional market and monetary union

Annex to the convention establishing the regional council, article 19, on public-offering criteria. The regional council's general regulation on licensed intermediary categories, professional cards, and the prohibition on suggesting licensed status. Instruction 065/CREPMF/2021 on minimum share capital and prudential norms for licensed brokers. Regulation 06/2024/CM/UEMOA on external financial relations.

Togo

Law 2019-014 of 29 October 2019 on the protection of personal data: the IPDCP, the three processing regimes, prior authorisation for biometric data, the receipt issued within one month, and authorisation of transfers abroad. Law 2017-007 of 22 June 2017 on electronic transactions with Decree 2018-062. Law 2017-006 on the information society. ARCEP as delegated authority for electronic certification.

■ Standing caveat

This annex records the instruments relied upon in drafting. It is not a legal opinion, and none of Section 3 substitutes for the counsel opinions required at gates G4 and G5.
